

Migration to a MaxCS All-Software Solution

The All Software Solution is a newly released MaxCS 6.7 configuration that allows for the entire MaxCS system to be run without any specialized hardware, allowing MaxCS to be run on independently sourced servers, or even in a virtualized server.

While the vast majority of server settings already familiar to AltiGen Technicians are unchanged from the traditional All-In-One hardware based solutions such as a Max2000, there are two major differences to be aware of. The first is the use of the HMCP virtual board in place of traditional VoIP boards, resource boards, and conference boards. The second major difference is the use of the soft system key which removes the need for the parallel port dongle which has been used in traditional systems. A mini course on the AltiGen learning portal addresses both of these issues.
