

MaxCS 7.5 MultiVoIP Configuration Guide

Updated 7/7/2015: Expanded "Operational Limitations" section.

This document provides guidelines for setting up a MultiTech gateway as a SIP trunking gateway, and for configuring SIP extensions.

The firmware version for MVP410 used in this example is 6.09.0a. The AltiGen IP phone firmware version needs to be 2xxx (SIP-based).

Requirements

Your system must be running MaxCS release 7.5. You must have a MultiTech MultiVoIP Voice over IP gateway (MVP210, MVP410, or MVP810). Both the MaxCS system and the MultiVoIP gateway need to have public IP addresses or be in the same private network range. NAT is not supported at this time. If private network addresses are used, an intranet (such as VPN, frame-relay, and so on) is required prior to configuration of the remote MultiVoIP gateway.
